

**MATHEMATICS 271 L01 FALL 2015**  
**QUIZ 1 SOLUTIONS**

1. Write the *negation* (in good English) of each of the following statements. The answer “It is not the case that ...” is **not** acceptable.

(a) For all real numbers  $x$  and  $y$ , if  $x$  is rational and  $y$  is irrational then  $x + y$  and  $xy$  are irrational.

**Solution:** There are real numbers  $x$  and  $y$  so that  $x$  is rational and  $y$  is irrational, but  $x + y$  or  $xy$  are rational.

(b) For all integers  $x$  and  $y$ , if  $x^2 + 3x = y^2 + 3y$  then  $x = y$  or  $x = -y$ .

**Solution:** There are integers  $x$  and  $y$  so that  $x^2 + 3x = y^2 + 3y$ , but  $x \neq y$  and  $x \neq -y$ .

(c) For all integers  $y$ , there exists an integer  $x$  so that  $y = x^2 - 2x$ .

**Solution:** There is an integer  $y$  so that for all integers  $x$ ,  $y \neq x^2 - 2x$ .

(d) There exists an integer  $n$  so that for all integers  $m$ ,  $2 \nmid n - m$  or  $3 \nmid n - m$ .

**Solution:** For all integers  $n$ , there exists an integers  $m$  so that  $2 \mid n - m$  and  $3 \mid n - m$ .

2. Prove that the statement: “There exists an integer  $n$  so that for all integers  $m$ ,  $n + m$  is odd and  $n - m$  is even.” is **false** by writing out its negation and prove that.

**Solution:** Its negation is: “For all integers  $n$ , there exists an integer  $m$  so that  $n + m$  is even or  $n - m$  is odd.” and below is a proof of the negation.

Suppose that  $n$  is an integer. Let  $m = -n$ . Then  $m$  is an integer and  $n + m = 0$  which is even.

3. Let  $\mathcal{P}$  be the statement: “For all integers  $a$  and  $b$ , if  $a \mid bc$  then  $a \mid b$  or  $a \mid c$ .”

(a) Prove that  $\mathcal{P}$  is false.

**Solution:**  $\mathcal{P}$  is false because with the integers  $a = 4$  and  $b = c = 2$ , we have  $bc = 6 = a = a \times 1$  where  $1 \in \mathbb{Z}$ , but  $a \nmid b$  and  $a \nmid c$  since  $4 \nmid 2$ .

(b) Write out the converse of  $\mathcal{P}$ . Prove that the converse of  $\mathcal{P}$  is true.

**Solution:** The converse of  $\mathcal{P}$  is: “For all integers  $a$  and  $b$ , if  $a \mid b$  or  $a \mid c$  then  $a \mid bc$ .” and below is a proof of the converse.

Let  $a$  and  $b$  be integers so that  $a \mid b$  or  $a \mid c$ . Then we have two cases:

Case 1:  $a \mid b$ . Then  $b = ak$  for some integer  $k$ , and therefore  $bc = (ak)c = a(kc)$  where  $kc$  is an integer. This implies  $a \mid bc$ .

Case 2:  $a \mid c$ . Then  $c = am$  for some integer  $m$ , and therefore  $bc = b(am) = a(bm)$  where  $bm$  is an integer. This implies  $a \mid bc$ .

(c) Write out the contrapositive of  $\mathcal{P}$ . Is the contrapositive of  $\mathcal{P}$  true? Explain.

**Solution:** The contrapositive of  $\mathcal{P}$  is: “For all integers  $a$  and  $b$ , if  $a \nmid b$  and  $a \nmid c$  then  $a \nmid bc$ .”

The contrapositive of  $\mathcal{P}$  is false because it is logically equivalent to  $\mathcal{P}$  which is proven to be false in part (a).
